

Unwinding/Rewinding and their Effect on Process Tension

PROCESS Unwind followed by pull rolls

EFFECT Pull rolls, either nip type or "S" wrap, provide a tension differential between the unwind and process thereby reducing the unwind web tension (PLI) requirement.

PROCESS Center winder

EFFECT Process tension similar to values listed. If a rider roll or lay-on roll is used in conjunction with center winding, the web tension required may be lower than listed values. Increased loading of rider roll on winding roll produces a tighter wound roll but reduces the required web tension (PLI).

PROCESS Surface winder or single-drum winder

EFFECT Process tension similar to values listed. Roll density greatly dependent on loading between winding roll and drum. Increased nip loading will produce a harder roll without increasing required web tension.

PROCESS Two-drum slitter rewriter

EFFECT Required tensions are usually higher due to the requirements for tight, hard rolls capable of withstanding rough treatment during handling and shipping.

Two examples of problems caused by poor tension control are shown below:

Telescoped Roll

Wrinkling

Tension Data for Typical Converting Applications

The adjacent table is a listing of recommended operation tensions for various materials and their corresponding basis weights and thicknesses. Tensions for materials manufactured on other than a 3000 sq. ft. per ream basis weight can be calculated by dividing 3000 by various weights and multiplying the result by the tabular listing.

EXAMPLE

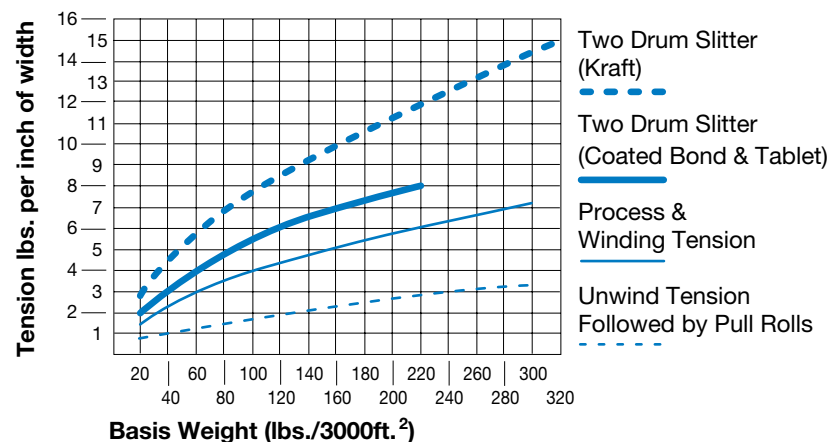

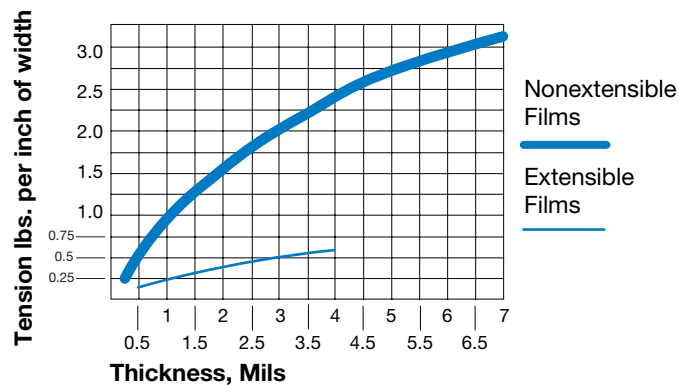

60 lb./1000 sq. ft.: $3000/1000 = 3$; $3 \times 60 = 180$, therefore 180 lb./3000 sq. ft.. One point (0.001"/0.0254mm) = 8 lbs. on a 3000 sq. ft. basis. Tensions for lamination can be found by adding the tensions of the separate materials. For coating operations add 0.12 PLI (0.021 kg./cm.) for every 0.001" (0.0254 mm) coating thickness.

NOTE

This is a guideline only. Actual tensions may vary depending upon the type of operation. (For example, slitting tension may be slightly lower, while coating and laminating tensions may be slightly higher than the values listed in the adjacent table.) When these substrates are coated with polyethylene, nylon, polypropylene, EVA, EAA, and EEA, add the following tension values to the values listed here for the substrate only.

Coating Thickness = approximate tension lbs./in.:
 0.0005" to 0.001" = 0.12 lb./in.
 0.0011" to 0.002" = 0.25 lb./in.

Suggested Tension Values for Specific Materials and Applications

| Material or Substrate | Thickness (inches) | Tension (PLI) | Tension (kg/cm) | Paper & Lamination |
|-----------------------|--------------------|---------------|-----------------|-------------------------------|
| Aluminum foils | 0.001 | 0.5-1.5 | 0.089-.268 | 20#/R-32.54 gm/m ² |
| Cellophane | 0.001 | 0.5-1.0 | 0.089-.179 | 40#/R-65.08 gm/m ² |
| Acetate | 0.001 | 0.5 | 0.089 | 60#/R-97.62 gm/m ² |
| Mylar (polyester) | 0.001 | 0.5-1.0 | 0.089-.179 | 80#/R-130.1 gm/m ² |
| Polyethylene | 0.001 | 0.25-.30 | 0.045-.054 | |
| Polypropylene | 0.001 | 0.25-.30 | 0.045-.054 | |
| Polystyrene | 0.001 | 1.0 | 0.179 | |
| Saran | 0.001 | 0.05-.20 | 0.009-.036 | |
| Vinyl | 0.001 | 0.05-.20 | 0.009-.036 | |
| Gauze (Cotton) | N/A | 0.25-0.50 | 0.045-.089 | |

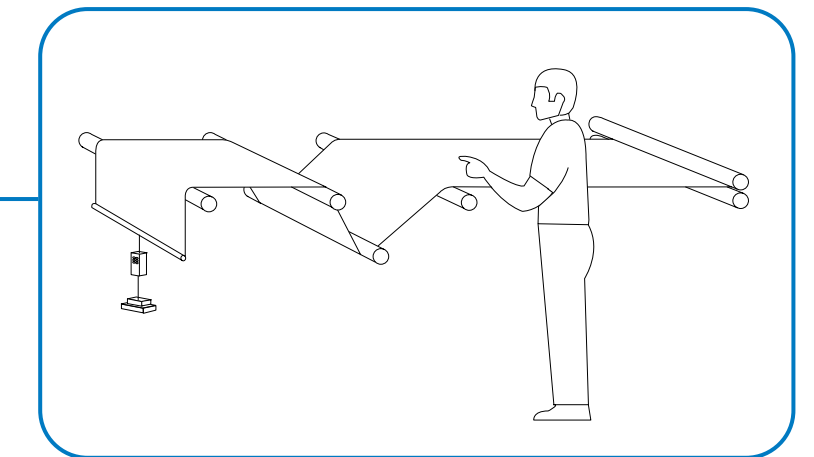

| Material or Substrate | Basis Wgt (lbs/3000 ft ²) | Tension (PLI) | Basis Wgt. (GSM) | Tension (kg/cm) |
|-----------------------|---------------------------------------|---------------|------------------|-----------------|
| Paper | 10 | 0.25 | 16.28 | 0.045 |
| | 15 | 0.50 | 24.41 | 0.089 |
| | 20 | 0.75 | 32.55 | 0.134 |
| | 30 | 1.00 | 48.83 | 0.179 |
| | 40 | 1.50 | 65.10 | 0.268 |
| | 50 | 1.75 | 81.38 | 0.313 |
| | 60 | 2.00 | 97.65 | 0.357 |
| | 70 | 2.25 | 113.93 | 0.402 |
| | 80 | 2.50 | 130.20 | 0.446 |
| | 90 | 2.75 | 146.48 | 0.491 |
| | 100 | 3.00 | 162.75 | 0.536 |
| | 120 | 3.50 | 195.30 | 0.625 |
| | 140 | 4.00 | 227.85 | 0.714 |
| | 160 | 4.50 | 260.40 | 0.804 |
| | 180 | 5.00 | 292.95 | 0.893 |
| | 200 | 5.50 | 325.50 | 0.982 |
| | 220 | 6.00 | 358.05 | 1.071 |
| 240 | 6.50 | 390.60 | 1.161 | |
| 260 | 7.00 | 423.15 | 1.250 | |
| 280 | 7.50 | 455.70 | 1.339 | |
| 300 | 8.00 | 488.25 | 1.429 | |

| Material or Substrate | Thickness (inches) | Tension (PLI) | Basis Wgt. (GSM) | Tension (kg/cm) |
|-----------------------|--------------------|---------------|------------------|-----------------|
| Paperboard | 0.008 | 3.00 | 104.16 | 0.536 |
| | 0.010 | 3.50 | 130.20 | 0.625 |
| | 0.012 | 4.00 | 156.24 | 0.714 |
| | 0.014 | 4.50 | 182.28 | 0.804 |
| | 0.016 | 5.00 | 208.32 | 0.893 |
| | 0.018 | 5.50 | 234.36 | 0.982 |
| | 0.020 | 7.00 | 260.40 | 1.250 |
| | 0.022 | 8.00 | 286.44 | 1.429 |
| | 0.024 | 9.00 | 312.48 | 1.607 |
| | 0.026 | 10.00 | 338.52 | 1.786 |
| | 0.028 | 11.00 | 364.56 | 1.964 |
| | 0.030 | 12.00 | 390.60 | 2.143 |
| | 0.035 | 13.00 | 455.70 | 2.322 |
| | 0.040 | 14.00 | 520.80 | 2.500 |
| | 0.045 | 15.00 | 585.90 | 2.679 |
| | 0.050 | 16.00 | 651.00 | 2.857 |
| | 0.055 | 17.00 | 716.10 | 3.036 |
| | 0.060 | 18.00 | 781.20 | 3.214 |
| | 0.065 | 19.00 | 846.30 | 3.393 |
| 0.070 | 20.00 | 911.40 | 3.572 | |

| Material or Substrate | Thickness (inches) | Tension (PLI) |
|---------------------------------------|--------------------|---------------|
| Mylar & Oriented Propylene | 0.0005 | 0.25 |
| | 0.0010 | 0.50 |
| | 0.0020 | 1.00 |
| Cellophane | 0.00075 | 0.50 |
| | 0.00100 | 0.75 |
| | 0.00200 | 1.00 |
| Nylon & Cast Propylene (Non-Oriented) | 0.00075 | 0.15 |
| | 0.00100 | 0.25 |
| | 0.00200 | 0.50 |

Alternative Method for Obtaining Accurate Tension Specifications for Your Application

Many applications not currently utilizing tension indication equipment are typically controlled manually by an operator who "feels" the tension in the web. The operator usually accomplishes this by resting a hand on the web during operation to measure the tightness in the web. When preparing to specify a closed loop tension system for these applications, tension values may not be typical of the values listed in the tables adjacent. To obtain more realistic values for your operation of web tension, you may want to utilize your operator's experience by using the following technique:

STEP 1

Find a section of web between two idlers within the tension zone where the operator checks the tension when he controls it manually. Then using the entire web, feed it through the normal wrapping configuration and secure one end using the nip rolls. Allow the other end to hang free. (Set up as shown in the illustration above.)

STEP 2

Now, attaching weights or using a spring scale, apply a force on the web while the operator feels the web for proper tension. Spin all idlers in the direction of the weight. When the proper tension is achieved, record the force. This value can now be used by The Montalvo Corporation to ensure proper sizing of our tension controlling and indicating products.
